Two new features in the {emayili} (0.4.6) package for easily sending emails from R.

## **Package Setup**

If you have not already installed the package, then grab it from CRAN or GitHub.

```
# From CRAN.
install.packages("emayili")
# From GitHub.
remotes::install_github("datawookie/emayili")
```

Load the package.

library(emayili)

Check that you have the current version.

```
packageVersion("emayili")
[1] '0.4.6'
```

Let's quickly set up an SMTP server. We'll use SMTP Bucket, which is incredibly convenient for testing.

```
SMTP_SERVER = "mail.smtpbucket.com"
SMTP_PORT = 8025

smtp <- server(host = SMTP SERVER, port = SMTP PORT)</pre>
```

## **UTF-8 Characters in Attachment Filenames**

It's now possible to attach files with names that include non-ASCII characters. Suppose I wanted to send this image (source) of Wenceslao Moreno.

The file name contains an accented character, ñ.

```
ACCENTED ATTACHMENT <- "señor-wences.jpg"
```

Attaching this file now works thanks to a contribution from Philipp Hallmeier.

```
# Create email and add attachment.
email <- envelope(</pre>
 from = "alice@gmail.com",
 to = "bob@gmail.com",
 subject = "Wenceslao Moreno"
) 응>응
 attachment (ACCENTED ATTACHMENT)
# Send it!
smtp(email)
Heading over to SMTP Bucket I can inspect the structure of the received email.

--3322251652a271341525323233--
```

We can confirm that the file name has been encoded correctly too. You'll find the file name on the Content-Disposition line above.

```
URLdecode("se%C3%Blor-wences.jpg")
[1] "señor-wences.jpg"
```

Note: I actually sent a scaled version of the image!

## **Setting Sender Field**

Sometimes the person who is sending the email is actually sending it on behalf of somebody else. Thanks to Robert Overman it's now possible to do this using the sender() function.

```
# Create email and specify the sender.
#
email <- envelope(
    to = "bob@gmail.com",
    subject = "Hi"
) %>%
    text("Hi Bob, it's Alice. I asked Craig to send this email.") %>%
    #
    # Craig is sending the message...
    #
    sender("craig@gmail.com") %>%
    #
    # ... but it's actually from Alice.
    #
    from("alice@gmail.com")
# Send it!
#
smtp(email)
```

This is what the resulting message looks like:

```
Date: Sat, 06 Mar 2021 04:13:50 GMT

To: bob@gmail.com

Subject: Hi

Sender: craig@gmail.com

From: alice@gmail.com

X-Mailer: {emayili}-0.4.6

MIME-Version: 1.0

Content-type: multipart/mixed; boundary="972f1d1f191e162e2320162ef182"

--972f1d1f191e162e2320162ef182
```

```
Content-Type: text/plain; charset=utf-8
Content-Disposition: inline
Content-Transfer-Encoding: 7bit

Hi Bob, it's Alice. I asked Craig to send this email.

--972fld1f191e162e2320162ef182--
```

In practice the Sender field would most often be used when a mail agent (with its own SMTP credentials) is sending messages on behalf of users.
